READING YOUR TANK'S GAUGE

Locating Your Gauge: The gauge can be found under the dome or lid of the tank. It is a small dial approximately 1.5"-2" in diameter.

Reading Your Gauge: You will notice that the face of the gauge has numbers arranged in a clockwise direction. These numbers indicate the **percentage of propane** remaining in the tank, not the gallons. The needle will point to the current percent full.

Why Was My Tank Only Partially Filled?: By nature, propane expands and contracts with the changing temperature. Tanks are only filled to approximately 80% to allow for expansion of the propane.

When Should I Call For A Delivery?: To ensure an uninterrupted supply of propane, we ask that you call, or email, when your gauge reads **20-25%** to place an order. This will allow us plenty of time to make a delivery the next time we are in your area.

Run outs must be pressure tested and service charges may result from this safety precaution. Run outs requiring off route, or after hours deliveries, may be subject to additional fees.
